

In my work, green colors prevail, since yellow and orange do not combine very well for me. And green is the color of money, as well as tranquility and nature.

Having this application, you should be calm, joyful, with money and you are making a contribution to nature without using paper money.

No need actions here.

That is just a loading screen
with the logo and name of the app.

Before I had not used the logo here, but a
suggestion was to have it here as well.
Without it, the loading screen was emptier.
As well, in future, the logo will be improved.

[Forgot password?](#)

You need to put your password-PIN here.

If you forgot your password, there is a button at the bottom. This button will help you figure it out further or get help with a forgotten password.

There was a box field for entering the password. But I was advised that it looks unsightly and ancient. Modern design does not require this extra element.

The erase button allows you to erase the last typed character, and then the box allows you to enter the application if the correct password was typed.

Instead of the word username, the user can use my nickname or leave it that way.

[Forgot password?](#)

I tried to change the color of this button to the same as the background. But that's not possible. I suggest you turn on your imagination. I was really looking for all sorts of ways.

This window is of such a color that it does not stand out much against the background, but there would be a separate view-a screen of other data. Thus, it was convenient to divide the tab screen into blocks with different functionality

I decided to use colors of the same shade.

The words that are important to remember (for example, you forgot your password) will be highlighted in a different color.

The main text is highlighted in large font.

The least important one is almost invisible, since most often it is read once (the text under the buttons home, transactions, address).

The text that disappears when you enter a gray color and is slightly darker than the background, since it does not carry important information.

I really liked the font itself. However, I would like to replace it in the user settings or on some buttons.

But then the font will be changed on all pages and in all places.

However, this text would be an ideal solution even for a full-fledged application!

The main text is black and stands out well against the background.

The background of the application icon, the boot screen and the password are the same shade.

After that, the background becomes slightly darker on all tabs.

The lower part of the buttons is on a very dark green, as it does not require excessive attention. It's just an opportunity to conveniently and quickly navigate through the tabs.

The small circle on top is the user's avatar. Clicking on it will take you to the main settings of the application.

Following the advice, a search was added. Firstly, it fills the empty space, which made the screen look incomplete. Secondly, it is easier to find the necessary tab from the main screen **home** by the word. This way you can go to any window, including settings, questions and answers, etc.

Next, we see how many bitcoins are in the account and we can look at this value in another currency.

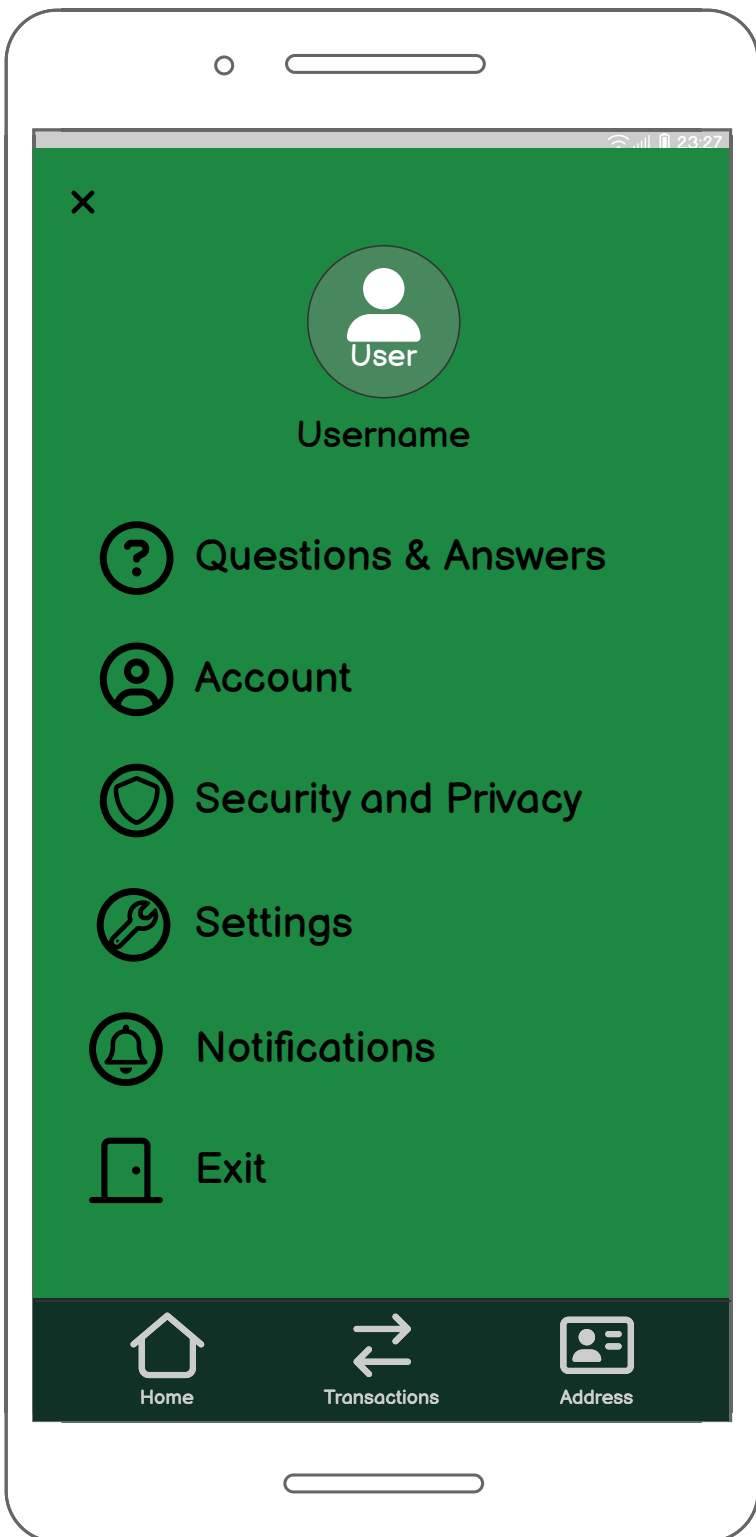

Then there is a list of recent transactions without detailed information.

By clicking on the more button, we will proceed to transactions.

There are three buttons at the bottom: the home button-sends home, the transaction button -to the transactions section and the address allows you to get a new addressee.

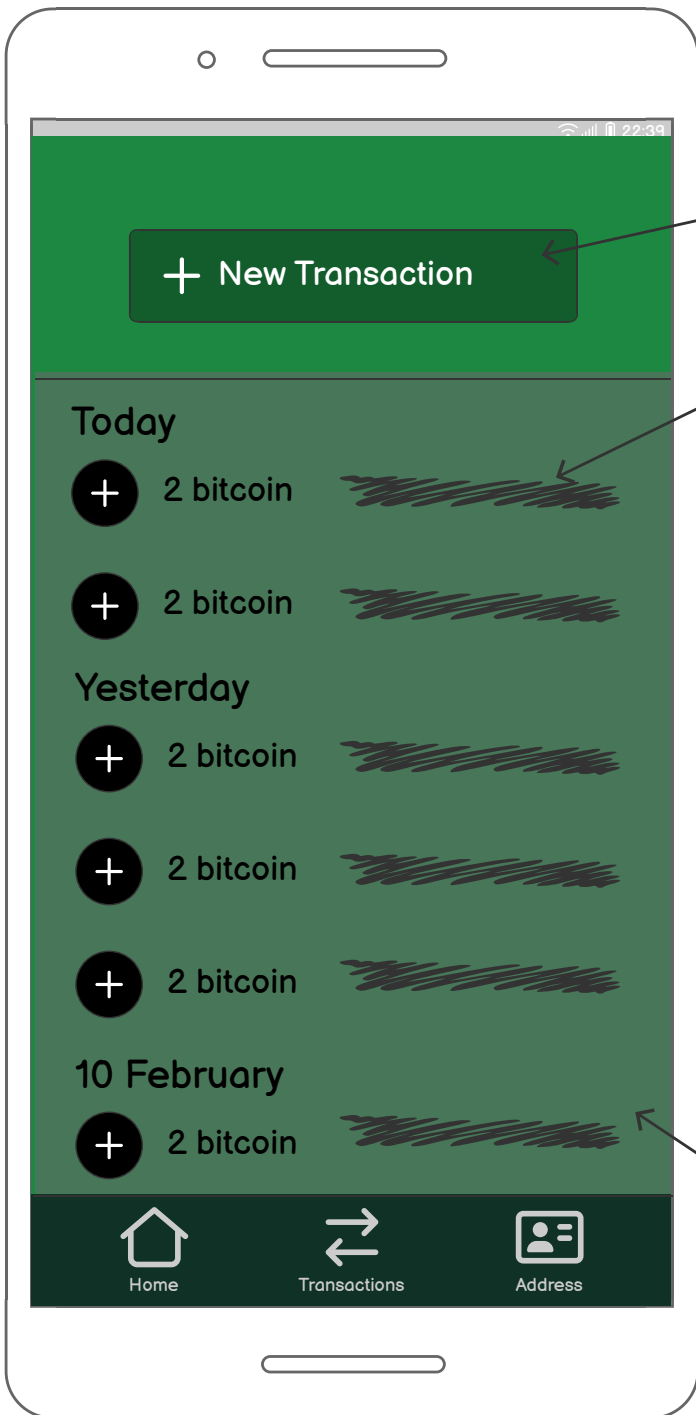

The appearance of the address button has been changed, as the icon was misleading before. IT could be confused with sending emails. However, it is now clear that this button provides information about the user's address for receiving or sending funds.

The appearance and name of the design button have changed. It was changed to settings. Everything else remained unchanged. And well, there is also a line at the bottom with the ability to go directly from here to transactions or an address.

Here the user has the opportunity to customize the interface - including the nickname and avatar (I did not set the main task to decorate this button, since it does not carry any information)

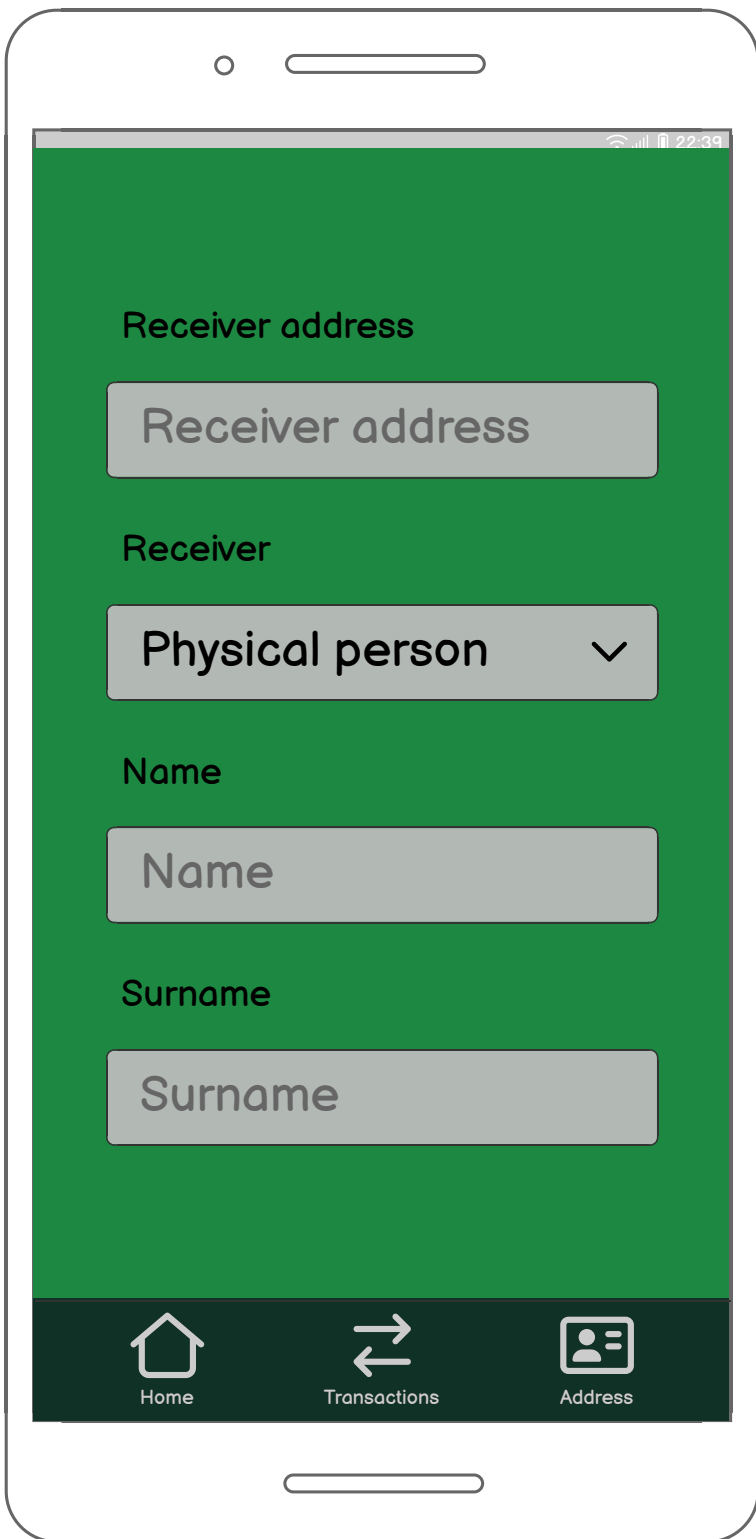

A bright and different color on the background to attract attention.
One of the most important buttons

some
important user
info

The user's avatar from above was removed from here, as it may interfere with the translation.

Here you can observe the opportunity to make a new translation.
You can also view transactions for the entire time you use the wallet.
Also, unlike the main screen, there is an opportunity to view more detailed information than how many bitcoins came or went

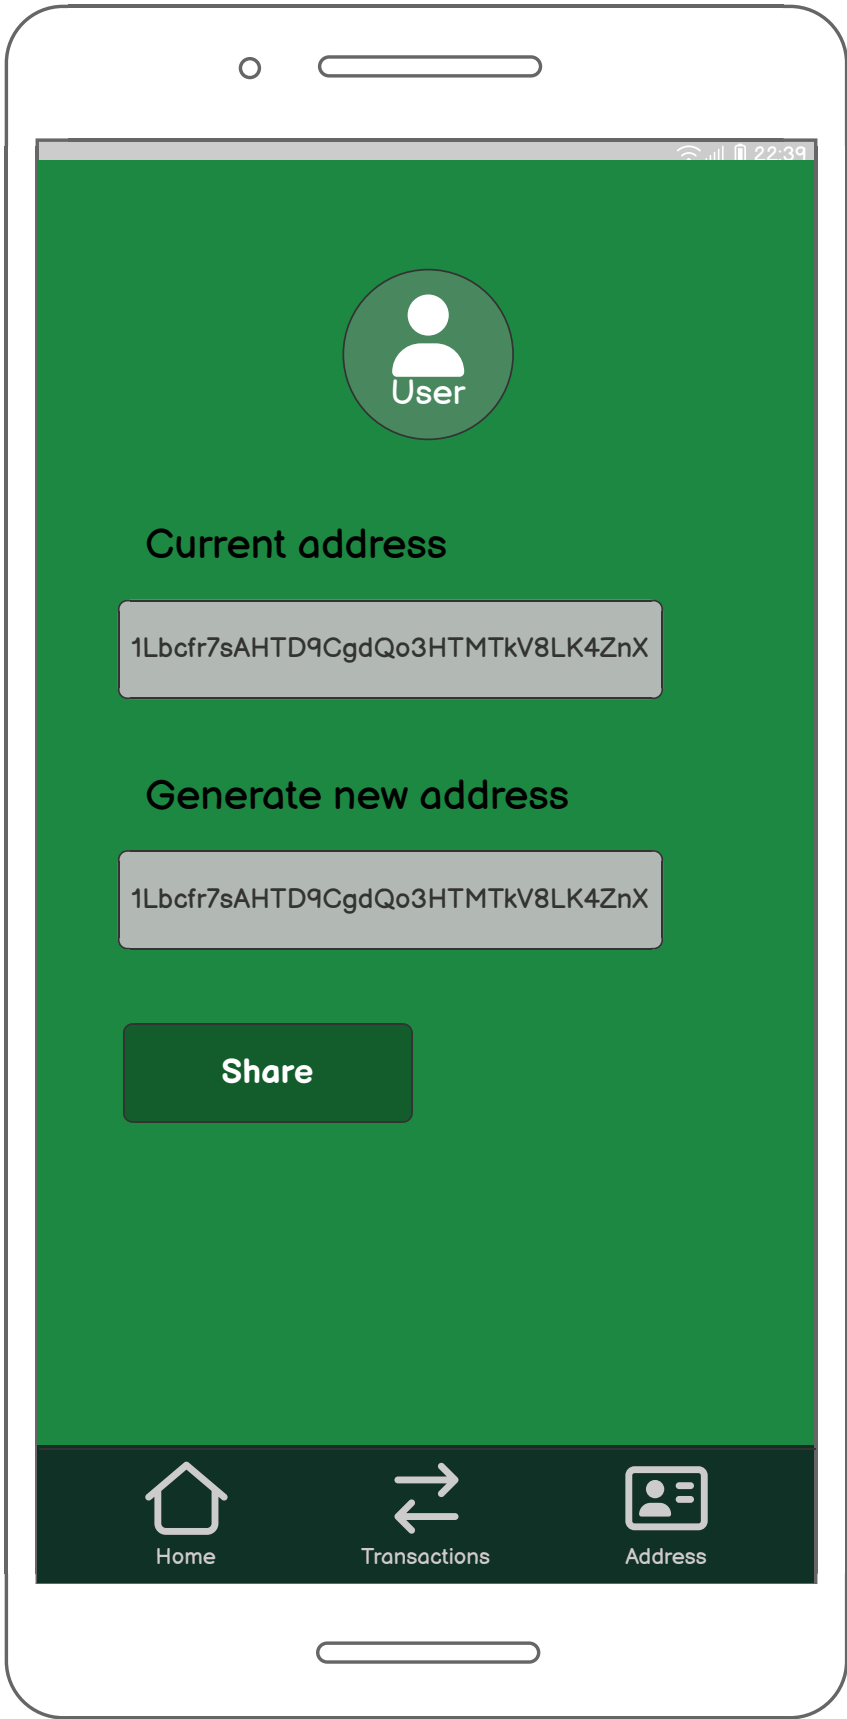

The same shade as on the main screen for convenient screen splitting into sections.

For the same reason, there is no avatar characters-a button to go to settings and questions. Everything else remained unchanged.

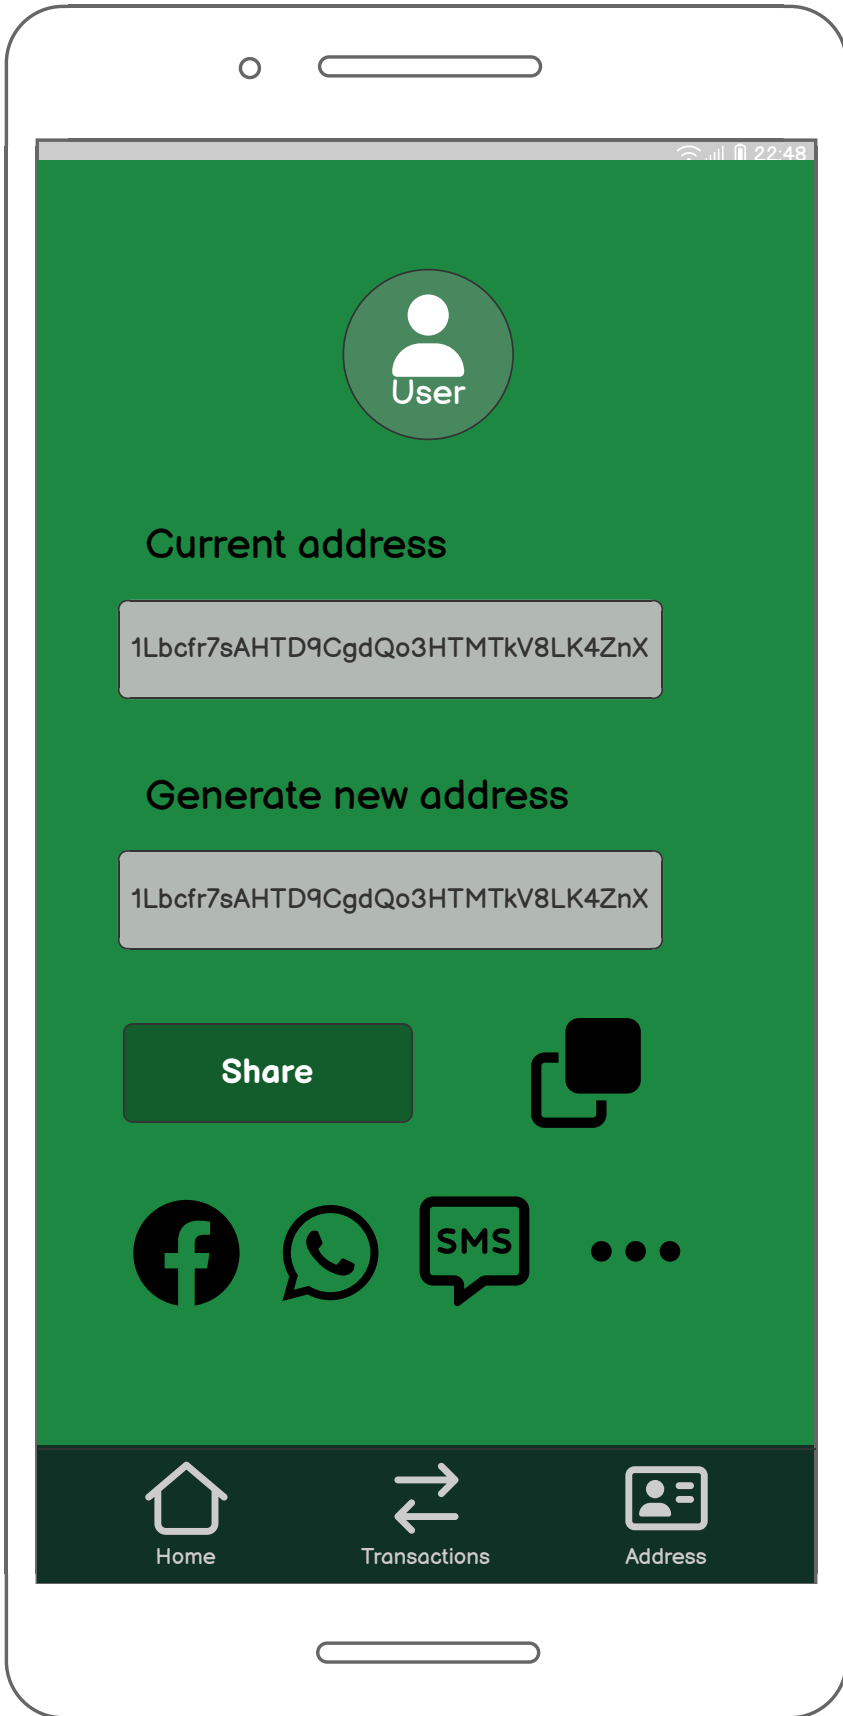

The interface has changed a little, or rather now the main name of the button is located on top. Inside the button itself, the information disappears when you type.

Information is also provided here in more detail now. The names of the field buttons are located at the top.

The name of the address is also copied by holding down the first button, or if you choose a way to share, the third button.

By pressing button 2, we have the ability to easily and quickly generate a new address.
